

Writeup for EventManagementApp:

The objective of this project is to develop an application wherein we can add, delete, edit employee details as per our wish during Angular.

In the process, we have followed the following steps:

1. First, we created a project using angular named EventManagement.
2. Secondly, we added the required scripts and loaded the bootstrap in index.html.
3. Created a service called crud, a json file to store the database of employees, a Employee.ts file to initialize the constructor and the respective parameters and also created a sign in form in signin.component.html.
4. After signing it shows the list of employees and we add the html code for this view in admin.component.html. and then we can add the details using add employee button for this we created a form in user.component.html.
5. After clicking view details it goes to details.component.html where we added the buttons to edit and delete.
6. After clicking edit it goes to edit.component.html where we can add to edit the information.
7. Then, to delete the employee we can click the delete button.
8. Added the required functions in respective .ts files. and also the required routing links and paths in app.routing.module.ts.
9. Finally, the output is printed on the console and is noted down for the future reference.
