

### **Write up for ProdcuDetailsFetching:**

1. First, we need to create a servlet based web application that shows a form to product details.
2. Then, we have to create another servlet which fetches the servlet and also creates a class to connect the database.
3. After that, fetching the servlet creates a form which shows the product ID and from there we can get the product details.
4. We have to create an index.html file to manage the front end part.
5. Run the survey after doing all these steps.
6. Finally, the output is printed on the console and is noted for future reference.
