

Writeup for MyPortfolio:

I have developed a website to create a frontend for the myPortfolio application.

In the process, we have used the following:

1. First, we created a project using angular named Portfolio.
2. Secondly, we created the required scripts and loaded the bootstrap in index.html.
3. Then created three components named signin,signup,dashboard.
4. Next, created a signup form in signup.component.html and sign in form in signin.component.html.
5. Also, I have created a background image in dashboard.component.html. And added the required functions in respective .ts files.
6. After that, I have created a navigation bar in app.component.html that includes signup and signin pages and added the required routinglinks and paths in app.routing.module.ts.
7. Finally, the output is printed on the screen and is noted down for future reference.
