Write Up:

1. Created a project with package name VirtualKey and class name Lockedme
2. Then, we need to import arraylists and scanner
3. After that, we have to print the choices that the user wanted like displaying the files in an order etc.
4. Take input of choice from the user
5. Using switch case 1, run the choices that user created and in case 2, there are options created for file handling purposes.
6. The program will be terminated in the outer 3rd switch case.
7. Finally, the output will be printed on the screen upon selecting the options that we have created earlier.
