WriteUp for UserAuthentication:

The aim of the project is to create a maven project to create JUnit class that will test all aspects of the authentication class.

1. First, we created a maven project with name UserAuthentication1
2. Secondly, a Java class with the name Authentication is created in com.simplilearn.demo package where we have given a mail id along with password that can be used in testing.
3. After that, JUnit class is created with the name AuthenticationTest in the same package in order to test the cases we created.
4. Finally, the project is run on JUnit server and the output is printed on the screen which is noted down for future reference.
