Writeup for AutomatedWebApplication:

The main objective of the project is to develop the automated script that can atomate the basic functionalities like registration and login.

In the process I have used the following steps:

1. First, we have created a project using Eclipse software named AutomatedWebApplication.
2. Next, downloaded the selenium jar files and loaded them in the java project.
3. Then, I downloaded the chrome driver and again loaded in the code using system.setproperty also loaded the link for the required website using driver.get method.
4. Also, I have maximized the windows website using driver.manage(), window(), maximize().
5. I have found the each element by findbyelementbyid method and I did the same for all the elements.
6. Then passed the required keys using sendkeys method.
7. Finally, the code is run and output is printed on the screen and is noted down for future reference.
